

SECURE NEW MEXICO'S LAND HERITAGE

Update the **Land Conservation Incentives Act**

For Our Land, Water, Economy, & Culture

RGALT's Socorro County conservation project protected 6,210 acres with LCIA and leveraged \$3M in USFWS NAWCA funding.

THE PROBLEM

- The Land Conservation Incentives Act (LCIA) has not been updated since 2008.
- New Mexico's land values have skyrocketed as development has transformed rural areas and threatened water supplies.
- The LCIA's tax credits are capped at 50% of conservation value, and \$250k total, which isn't enough to incentivize protection of our most threatened landscapes.
- These caps are especially problematic for land rich/cash poor New Mexicans and those with senior water rights.

THE SOLUTION

- It's simple: update the caps.
- Increasing the amount of conservation value for which landowners can be compensated to 80% will allow more small scale landowners and farmers to keep New Mexico's land heritage alive.
- Boosting the cap on each transaction to \$2M will allow for more landscape-scale projects that protect watersheds & wildlife.
- This approach is modeled on that of Colorado's conservation easement tax credit, which has been wildly successful in increasing the pace of conservation.

WHY IT'S IMPORTANT

- The protection of working lands, natural habitat, and water resources is essential to sustain agricultural production, wildlife corridors, watersheds, and ecosystem resiliency.
- Conservation easements ensure land remains undeveloped in areas that are critical for watershed health and other ecosystem services that sustain New Mexican livelihoods.
- Historic and cultural resources are vulnerable on private lands, and conservation easements offer protections for sensitive archeological sites important to our Tribal and Pueblo communities.
- LCIA has been successful in New Mexico, protecting 584,628 acres with \$39,011,614 in tax credits issued – a cost of just \$66 per acre conserved.
- Increasing the LCIA cap would help mitigate high transaction costs, allowing more landowners to protect their land. This would make conservation more equitable and accessible to landowners across the economic spectrum, including those in our acequia and traditional communities who have been stewarding their lands for generations.

Protecting land and water helps sustain working agricultural lands, wildlife habitat, outdoor recreation, scenic vistas, and our cultural heritage, which are cherished by both urban and rural communities.
